

**Southwest Power Pool**  
**TRANSMISSION WORKING GROUP MEETING**  
**September 13, 2010**  
**Net conference**

• M I N U T E S •

**Agenda Item 1 – Administrative Items**

TWG Chair Noman Williams called the meeting to order at 1:00 p.m. The following people were in attendance: (Attachment 1 – Proxies)

**TWG Members**

Noman Williams, Sunflower Electric Power Corp  
John Chamberlin, City Utilities of Springfield  
Angela Easton, Calpine Energy Services  
Jason Fortik, Lincoln Electric System  
Ronnie Frizzell, Arkansas Electric Cooperative  
Travis Hyde, Oklahoma Gas and Electric  
Dan Lenihan, Omaha Public Power District  
Sam McGarrah, Empire District Electric  
Nathan McNeil, Midwest Energy  
Matt McGee, American Electric Power  
John Payne, Kansas Electric Power Cooperative  
Jason Shook, GDS Associates for ETEC  
Don Taylor, Westar Energy  
Mitch Williams, Western Farmers Electric Coop  
Brian Wilson for Harold Wyble, Kansas City Power & Light

**Other Stakeholders and Staff**

Syed Ahmad, FERC  
Roy Boyer  
Charles Cates, SPP Staff  
Bruce Cude, Southwestern Public Service Company  
Tom DeBaun, Kansas Corporate Commission  
Tony Gott, Associated Electric Cooperative  
Rachel Hulett, SPP Staff  
Bob Lux, SPP Staff  
Kristen Rodriguez  
Al Tamimi, Sunflower Electric Power Corp  
Keith Tynes, SPP Staff

**Agenda Item 2 – ITP Manual**

The group reviewed and revised the remaining portions of the ITP manual under TWG purview (Attachment 2 – ITP Manual). The TWG noted MDWG is currently revising Appendix A of the manual and asked that the Authorizations to Plan (ATPs) to be included in the model building process.

**Don Taylor, Westar Energy, motioned to approve the ITP Manual including all TWG edits  
Ronnie Frizzell seconded the motion which was approved unopposed.**

RTWG will review the ITP manual prior to the October MOPC meeting to ensure its consistency with the Tariff. It was noted that any RTWG changes to the manual would come back to TWG.

**Agenda Item 3 – Adjournment**

The next meeting is October 4 in Dallas with ESWG.

With no further business, Noman Williams adjourned the meeting at 2:59 p.m.

Respectfully Submitted,

Rachel Hulett  
TWG Secretary

## KCPL, Brian Wilson for Harold Wyble

---

**From:** Wyble Harold [mailto:Harold.Wyble@kcpl.com]

**Sent:** Wednesday, September 08, 2010 1:33 PM

**To:** Rachel Hulett; 'Williams, Noman'

**Cc:** Wilson, Brian

**Subject:** TWG 9/13/10 Net Conference

Brian Wilson will have my proxy for this net conference.

# Draft

## Integrated Transmission Planning Manual

103 **I. Introduction**

104  
105 **A. Acronyms and Definitions**

- 106  
107 1. AECl – Associated Electric Cooperative, Inc.  
108 2. APC – Adjusted Production Cost: APC is a dollar value calculated by adding the cost of  
109 producing energy to the cost of energy purchases and subtracting the revenue from  
110 energy sales  
111 3. ATP – Authorization to Plan: The ATP is a status given to a project which indicates that  
112 the BOD has approved the project in the SPP ITP and it has not yet been issued an NTC  
113 because it is outside of the NTC financial commitment window.  
114 4. BOD – SPP Board of Directors/Members Committee: The BOD is the governing body of  
115 SPP  
116 5. EHV – Extra High Voltage: In this document EHV refers to transmission at 345kV or  
117 greater  
118 6. ESWG – Economic Studies Working Group: The ESWG reports to the MOPC and  
119 advises and assists SPP staff, various working groups and task forces in the  
120 development and evaluation principles for economic studies  
121 7. FERC – Federal Energy Regulatory Commission  
122 8. ITP – Integrated Transmission Plan: The ITP is SPP’s approach to planning  
123 transmission needed to maintain reliability, provide economic benefits, and achieve  
124 public policy goals to the SPP region in both the near and long-term  
125 9. LMP – Locational Marginal Price: Also known as nodal pricing, the LMP is the  
126 incremental cost to the system that would result from one additional unit of energy that is  
127 demanded at a particular node  
128 10. MAPP – Mid-Continent Area Power Pool  
129 11. MDWG – Model Development Working Group: The MDWG is responsible for  
130 maintenance of an annual series of transmission planning models (powerflow and short  
131 circuit models and associated stability database) which represent the current and  
132 planned electric network of SPP  
133 12. MISO – Midwest Independent System Operator  
134 13. MOPC – Markets and Operations Policy Committee:  
135 14. MTF – Metrics Task Force: The MTF is a task force created by the ESWG to create a  
136 list of metrics for the ESWG to consider for use in evaluating projects in the ITP  
137 15. NERC – North American Electric Reliability Corporation  
138 16. NERC TPL – NERC Transmission Planning Standards  
139 17. NTC – Notification to Construct: The NTC is a formal SPP document specifying  
140 approval of and notification to build specific network upgrades with specified need dates  
141 for commercial operation  
142 18. OATT – Open Access Transmission Tariff: SPP’s transmission tariff as posted on SPP’s  
143 website  
144 19. PJM – PJM Interconnection  
145 20. PTDF – Power Transfer Distribution Factor: A PTDF is the percentage of power transfer  
146 flowing through a facility(ies) for a particular transfer when there are no contingencies,  
147 21. ROW – Right-of-Way: The ROW identifies the strip of land which is needed for  
148 transmission purposes  
149 22. RSC – Regional State Committee: The SPP RSC provides collective state regulatory  
150 agency input on matters of regional importance related to the development and  
151 operation of bulk electric transmission  
152 23. SERC – SERC Reliability Corporation  
153 24. SPP – Southwest Power Pool, Inc.: SPP is a Regional Transmission Organization

Deleted: amount  
Deleted: that will  
Deleted: given a particular source and sink  
Deleted: based on the impedance of the system

- 159 25. SPPT – Synergistic Planning Project Team (SPPT): The SPPT is a team which was
- 160 created to address comprehensive transmission planning processes and allocation of
- 161 transmission costs associated with both existing and strategic issues including
- 162 transmission service, generator interconnection, Extra High Voltage (EHV) inter-regional
- 163 transmission, wind integration, etc
- 164 26. STEP – SPP Transmission Expansion Plan: The STEP is an annual plan which
- 165 summarizes activities that impact future development of the SPP transmission grid
- 166 27. TLR – Transmission Loading Relief: A TLR is a process which is used to reduce loading
- 167 on lines which are at risk for an overload
- 168 28. TWG – Transmission Working Group: The TWG reports to the MOPC and is
- 169 responsible for planning criteria to evaluate transmission additions, seasonal ATC
- 170 calculations, seasonal flowgate ratings, oversight of coordinated planning efforts, and
- 171 oversight of transmission contingency evaluations
- 172

## 173 **B. Purpose**

174  
175 The SPP Tariff (OATT) in Attachment O Section III.8.d requires that Southwest Power Pool, Inc.  
176 (SPP) assess the cost effectiveness of proposed transmission projects in accordance with the  
177 Integrated Transmission Planning Manual. This manual will outline the processes for the three  
178 Integrated Transmission Planning components: 20-Year, 10-Year, and Near-Term  
179 Assessments.

## 181 **C. ITP Overview**

182  
183 The Integrated Transmission Plan (ITP) is SPP's approach to planning transmission needed to  
184 maintain reliability, provide economic benefits and achieve public policy goals to the SPP region  
185 in both the near and long-term. The ITP enables SPP and its stakeholders to facilitate the  
186 development of a robust transmission grid that provides regional customers improved access to  
187 the SPP region's diverse resources. Development of the ITP was driven by planning principles  
188 developed by the Synergistic Planning Project Team (SPPT), including the need to develop a  
189 transmission backbone large enough in both scale and geography to provide flexibility to meet  
190 SPP's future needs.

191  
192 The ITP is an iterative three-year process that includes 20-Year<sup>1</sup>, 10-Year, and Near-Term  
193 Assessments and targets a reasonable balance between long-term transmission investment  
194 and customer congestion costs (as well as many other benefits).

195  
196 The ITP creates synergies by integrating existing SPP activities: the Extra High Voltage (EHV)  
197 Overlay, the Balanced Portfolio, and the SPP Transmission Expansion Plan (STEP) Reliability  
198 Assessment. Consequently, and reaching the balance above, efficiencies are expected to be  
199 realized in the Generation Interconnection and Aggregate Transmission Service Request study  
200 processes. The ITP works in concert with SPP's existing sub-regional planning stakeholder  
201 process, and parallels the NERC TPL Reliability Standards compliance process.

202  
203 The Economic Studies Working Group (ESWG) was also formed in conjunction with the  
204 development of the ITP and will maintain the processes and metrics on an ongoing basis for  
205 qualifying and quantifying the transmission projects for the 20-Year and 10-Year Assessments.  
206

---

<sup>1</sup> The first iteration of the 20-Year Assessment is studying only year 20. However, in the future ITPs multiple years may be studied in addition to the year 20.

207 The Transmission Working Group (TWG) will maintain the process on an ongoing basis for  
208 qualifying and quantifying the transmission projects for the Near-Term Assessment.

209 ITP recommendations that are reviewed by the Market Operations and Policy Committee  
210 (MOPC) and approved by the Board of Directors (BOD) will allow staff to issue Notification to  
211 Construct (NTC) letters for approved projects needed within the financial commitment horizon.  
212 An Authorization to Plan (ATP) will be issued for projects needed beyond the financial horizon.  
213 Once an ATP is issued, the project will be reviewed annually to ensure the continued need for  
214 the project and the proper timing.

215  
216  
217 Successful implementation of the ITP will result in a list of transmission expansion projects,  
218 projected project costs and completion dates that facilitate the creation of a cost-effective,  
219 robust, and responsive transmission network in the SPP footprint.

## 220 221 222 **D. Background**

223 In January of 2009 the BOD created the SPPT to address gaps and conflicts in SPP's  
224 transmission planning processes; to develop a holistic, proactive approach to planning that  
225 optimizes individual processes; and to position SPP to respond to national energy priorities.

226  
227 The SPPT recommended the organization adopt a new set of planning principles; develop and  
228 implement an ITP; develop a plan to monitor the construction of projects approved through the  
229 ITP process; and identify Priority Projects that continue to appear in system reviews as needed  
230 to relieve congestion on existing constraints and connect SPP's eastern and western regions.  
231 The SPPT recommended that the Regional State Committee (RSC) establish a "highway-  
232 byway" cost allocation methodology for approved projects.<sup>2</sup>

233  
234 The SPPT created the following principles to drive development of the ITP:

- 235 • Focus on regional needs, while considering local needs as well; long range plans (both  
236 20-year and 10-year) are to be updated every three years while near-term plans are to  
237 be updated annually.
- 238 • Plan the backbone transmission system to serve SPP load with SPP resources in a cost-  
239 effective manner. The transmission backbone will:
  - 240 ○ Enhance interconnections between SPP's western and eastern regions
  - 241 ○ Strengthen existing ties to the Eastern Interconnection.
  - 242 ○ Provide options for planning and coordination to the Western Electricity  
243 Coordinating Council and the Electric Reliability Council of Texas grids in the  
244 future.
- 245 • Incorporate 20-year physical modeling and 40-year financial analysis timeframe.
- 246 • Better position SPP to proactively prepare for and respond to national priorities while  
247 providing flexibility to adjust expansion plans.

248  
249 SPP began performing its planning duties in accordance with the ITP process in January of  
250 2010, shortening the 20-year Assessment from an 18 month process to a 12 month process.

251  
252

---

<sup>2</sup> The Highway-Byway cost allocation was approved by FERC on June 17, 2010.  
<http://elibrary.ferc.gov/idmws/nvcommon/NVintf.asp?slcfilelist=12369183:0>

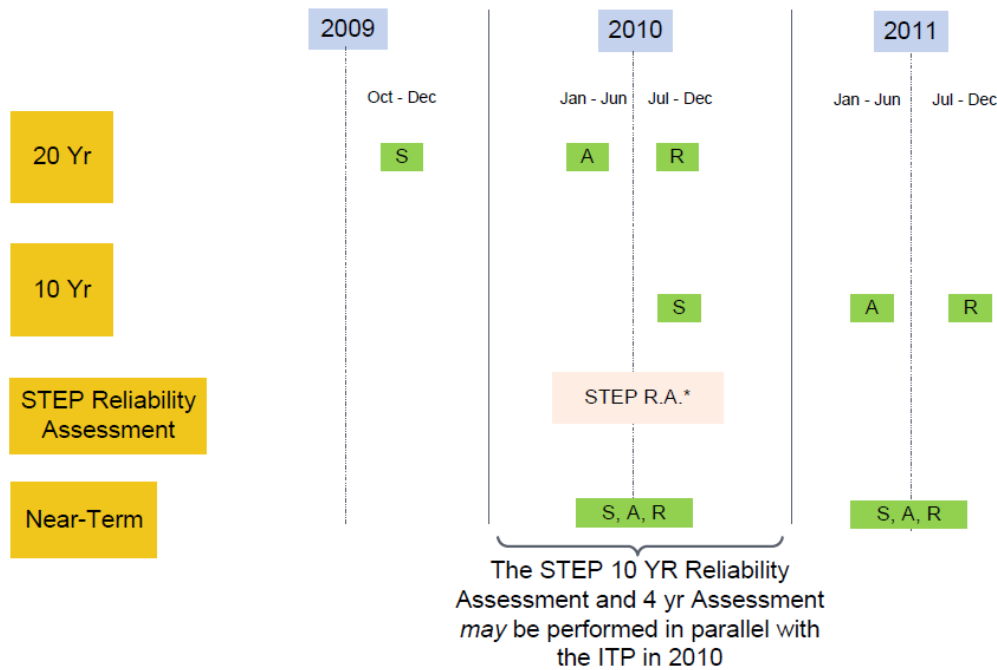

253 **II. Transmission Planning Upgrade Process**

254 **A. ITP Process & Schedule**

255 Beginning in November 2009, SPP began working with stakeholders to develop the scenarios  
 256 for the 20-Year Assessment with results to be presented in January 2011.<sup>3</sup> The 10-Year and  
 257 Near-Term Assessments will be performed in 2011, with results presented in January 2012.  
 258  
 259  
 260

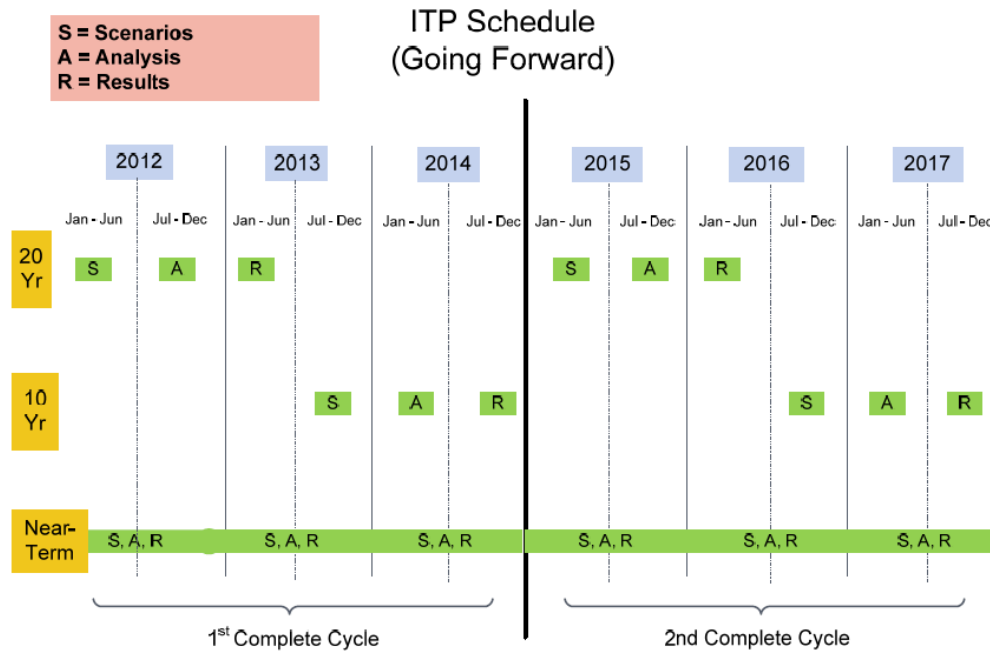

**S = Scenarios & Modeling**  
**A = Analysis**  
**R = Results**

**ITP Schedule  
 (Transition Cycle)**

261  
 262  
 263  
 264 Moving forward, evaluation of future scenarios that may affect the ITP will occur during the first  
 265 half of 2012 for the 20-Year Assessment and during the second half of 2013 for the 10-Year  
 266 Assessment. The 20-Year Assessment will begin in year one and be completed in year two. The  
 267 10-Year Assessment will begin during year two and be completed in year three. The Near-Term  
 268 Assessment will be performed each year to ensure reliability and to incorporate local planning  
 269 requirements.  
 270

<sup>3</sup> ITP Final Process Document - [http://www.spp.org/publications/ITP\\_Process\\_Final\\_20091029.pdf](http://www.spp.org/publications/ITP_Process_Final_20091029.pdf)

 290  
 291  
 292  
 293

The ITP process is an iterative three-year component of the STEP that includes 20-Year, 10-Year, and Near-Term Assessments. Each of these assessments targets a reasonable balance between long-term transmission investment and customer congestion costs. Investment in transmission lowers the congestion costs (among many other benefits) to which customers are exposed but this benefit must be weighed against the cost of the investment. As each assessment concludes more clarity is provided concerning appropriate investments in new transmission. Finding the appropriate investments is dependent on the assumptions used to represent possible future outcomes. This targeted approach is both forward-looking and proactive by designing with an end in mind of having a cost-effective and responsive transmission network which adheres to the ITP principles and also keeps the FERC “Nine Transmission Principles” in the forefront.<sup>4</sup>

**B. Cost-Effective Analysis & Robustness Evaluation**

Analysis will be performed following the adoption of the study assumptions and will focus upon both cost-effectiveness and robustness.

Cost-effective analysis is a form of economic analysis that compares the relative costs and outcomes (effects) of two or more courses of action. In effect, the benefits side of the equation is held constant at some pre-determined standard of service, and various options for providing

<sup>4</sup> These FERC principles are coordination, openness, transparency, information exchange, comparability, dispute resolution, regional participation, economic planning (congestion) studies, and cost allocation for new projects, as described more fully in Order 890, Final Rule, pages 245 – 323.

294 that standard of service are then compared, with the least-cost method identified as the  
295 preferred option. This method is distinct from cost-benefit analysis, which assigns a monetary  
296 value to the measure of effect with the most balanced outcome of costs and effects is identified.  
297 Cost-effective and cost-benefit analyses ask two different questions, “is the equation balanced”  
298 and “How can I achieve my goals in the most effective manner?”  
299

300 An evaluation of robustness involves a different perspective than does the cost  
301 effectiveness analysis. Robustness includes an evaluation of changes to cost-effective  
302 transmission plans for flexibility as well as increment cost and benefits. Metrics of  
303 robustness may be quantitative and/or qualitative.

### 304 **1. Development of Assumptions**

305  
306 Assumptions used in the ITP will be developed during the first and second year of each  
307 three-year ITP cycle for the 20-Year and 10-Year Assessments, respectively, and  
308 annually for the Near-Term Assessment. Assumptions will include those needed for  
309 economic studies, reliability studies, and futures development.  
310

311 The ESWG will guide the development of the assumptions used in the economic  
312 assessments and the TWG will guide the development of the assumptions for the  
313 reliability impact assessments.  
314

315 Once developed, staff will present the assumptions within an ITP study scope document  
316 for approval by the ESWG, TWG, and MOPC (with review from the RSC) as appropriate.  
317 The scope of each assessment will be revisited at the beginning of each three-year  
318 cycle of the ITP.  
319

320 In addition to any assumptions identified by the ESWG and TWG, the analysis must  
321 also encompass a plausible collection of assumptions for each specific model run  
322 including, but not limited to, varying levels of the following:

- 323 • Renewable Electricity Standards
- 324 • Load growth
- 325 • Demand response
- 326 • Energy efficiency
- 327 • Fuel prices
- 328 • Environmental and governmental regulations
- 329 • Resource (e.g. generation, transmission, smart grid) Technology
- 330 • Public Policy

331  
332

### 333 **C. Recommendations and Results**

334  
335 A list of projects from the assessments performed throughout the year will be presented to  
336 stakeholders for discussion and review at an SPP planning summit. Staff will then make any  
337 necessary adjustments to the ITP based on stakeholder feedback. The final plan will be  
338 included as a component of the STEP report and presented to the MOPC and the BOD.  
339

### 340 III. Twenty-Year Integrated Transmission Planning

#### 341 A. Purpose

342 The first phase of the ITP process is the 20-Year Assessment<sup>1</sup> which will be used to develop an  
343 EHV backbone network. The value-based planning assessment will use a diverse array of  
344 power system and economic analysis tools to thoroughly study the transmission system to  
345 identify cost-effective and robust backbone projects needed to provide a grid flexible enough to  
346 reasonably accommodate possible changes characterized by the various scenarios. Because  
347 the degree to which the power transmission landscape will change over this time frame is not  
348 currently known, transmission system expansion will be designed with flexibility (i.e., enables  
349 the ability of the transmission grid to meet a range of possible resource futures) in mind. The  
350 projects identified as a result of the 20-Year Assessment will be expected to provide benefits to  
351 the region across multiple scenarios.  
352  
353

#### 354 B. Futures Evaluation

355 Due to the uncertainties involved in forecasting future system conditions, a number of diverse  
356 futures or scenarios will be considered that take into account multiple variables. Consideration  
357 of multiple futures or scenarios will provide for a transmission expansion plan that will evolve as  
358 economic, environmental, regulatory, public policy, and technological changes arise that affect  
359 the industry. Initiatives such as plug-in hybrid electric vehicles, smart grid, renewable electricity  
360 standards, environmental regulations, energy storage and conversion applications, and other  
361 future technologies will change the way the electric grid is utilized. The futures are defined by  
362 the SPP Strategic Planning Committee (SPC). Based on direction of the SPC, the ESWG  
363 would further develop the assumptions and the inputs for the futures.  
364  
365  
366

#### 367 C. Data Requirements & Assumptions

368 Each stakeholder will have the opportunity to submit data and review their individual data which  
369 is being used for the study. The original data set to be used in the model will be provided by the  
370 vendor retained by SPP. That data is then reviewed by the stakeholders who can then provide  
371 specific updates to non-sensitive data. Data pertaining to unit costs and heat rate will not be  
372 updated by stakeholders. The ESWG will coordinate the submitting and vetting of all data used  
373 in the economic analysis. This data includes generating unit information, load, wind profiles,  
374 emission prices, fuel prices, etc.  
375  
376  
377

##### 378 1. Confidentiality of Data

379 In addition to the treatment with respect to reporting requirements in Section 2.6, in all other  
380 activities SPP staff will take all reasonable efforts to preserve the confidentiality of information in  
381 accordance with the provisions of the OATT (i.e., Sections 17.2(iv) and 18.2(vii); Attachment V  
382 (Section 13.1 and Article 22 of Appendix 6); Exhibit 1 (Section 2.3); Attachment AJ (Section 8);  
383 and Attachment C-One (Clause 7)).  
384

##### 385 2. Modeling Footprint

386

387 The modeling footprint will include the entire SPP region and nearby areas within the Eastern  
388 Interconnection. The non-SPP areas that may be modeled are MAPP, Midwest ISO, and the  
389 western portions of PJM and SERC.

### 390 **3. Generating Unit Modeling Data**

391  
392 Generating unit modeling data is required to perform a detailed analysis of economic upgrades.  
393 Stakeholders are asked to review the data inputs for their generating units. Specific data types  
394 will be derived from publically available inputs provided by the vendors. These data types  
395 include: Variable O&M, Variable O&M Escalation, Fixed O&M, Fixed O&M Escalation, Energy  
396 Bid Cost, Energy Bid Markup, Spinning Reserve Bid, Spinning Reserve Bid Escalation, Heat  
397 Rate, Startup Cost Adder, and Startup Cost Adder Escalation. These specific inputs use  
398 publically available data to ensure that the model will not contain sensitive data.  
399

400 Stakeholders will be asked to review and provide updated values (if necessary) for certain data  
401 items. These data types include but are not limited to: Maximum MW Output, Minimum MW  
402 Output, Must-Run status, Minimum Up Time, Minimum Down Time, Ramp Rate, Forced Outage  
403 Rate, Forced Outage Duration, Maintenance Hours Requirement, Minimum Runtime, Startup  
404 Energy Requirement, Fuel Type, and Emission Rates. For the resource planning phase of this  
405 study, stakeholders will be asked to review and update a smaller set of input data.  
406

### 407 **4. Wind Resources**

408  
409 Futures may require the modeling of additional wind capacity above what is currently in service  
410 at the time of the assessment. The amount of wind which will be modeled is defined in the ITP  
411 Futures document which is proposed by the ESWG and approved by the appropriate governing  
412 committee. The target wind level is then met by including additional wind sites in the modeling  
413 footprint. The size and locations of these additional wind farms are approved by the ESWG.

### 414 **5. Load Forecast Assumptions**

415  
416 A base load forecast used for the 20-Year Assessment will be approved by the Model  
417 Development Working Group (MDWG) and reviewed by the TWG and ESWG. Sensitivities may  
418 be developed for the futures.  
419

### 420 **6. Fuel and Emission Prices**

421  
422 SPP staff will assist the ESWG to formulate the fuel and emission price forecasts. These  
423 forecasts will then be approved by the ESWG for use in the production cost model.  
424

### 425 **7. Import/Export Limits**

426  
427 The ITP will focus on benefits to the SPP region. The interchange between SPP and other  
428 regions be kept to a minimum percentage of SPP's total load and capacity. The imports and  
429 exports will be set and benchmarked using hurdle rates and expected external system  
430 conditions for twenty years in the future. The ESWG will review the hurdle rates and the  
431 resulting imports/exports for both the resource planning and production cost modeling phases of  
432 the study. Different hurdle rates may be used to accommodate import and export scenarios

433 within the futures depending on the study scope. The system representation at seams will be  
434 reflective of expected facilities and arrangements that are consistent with the SPP futures being  
435 modeled. All of the ties within the SPP footprint will be modeled based on historical data. This  
436 historical data will be the most recent year available.

437  
438  
439  
440

## 441 **D. Modeling Methods**

### 442 **1. Model Development**

443

444 As described in the sections below, the models used in the 20-Year Assessment are developed  
445 based on information accumulated from various sources. The model building process starts  
446 with a package utilizing publicly available data. The economic model is then reviewed  
447 members. In addition, the powerflow model is imported into the economic model so that the  
448 transmission topology is up-to-date. Other parts of the model development include adding a  
449 generation expansion plan (resource planning) and developing a list of constraints (constraint  
450 selection). [SPP does not use Transmission Operating Guides in its 20-Year Assessment](#)  
451 [analyses.](#)  
452

### 453 **2. Security-Constrained Economic Dispatch**

454

455 The economic dispatch model will include stakeholder-vetted data. Unit cost related data such  
456 as costs and heat rates will be taken from publically available sources. Other data about the  
457 physical characteristics of generators that are not related to costs and heat rates will be  
458 reviewed and updated as needed by the members to provide company-specific values. These  
459 data will be used to produce the security-constrained economic dispatch (SCED) solution. The  
460 SCED solution requires dual optimization processes.

461

462 The first process is the security constrained unit commitment (SCUC). Here, the least cost  
463 combination of units is determined subject to unit-specific operational constraints (e.g., ramping,  
464 minimum output, min/max runtime, etc.), and some critical location-specific transmission  
465 reliability constraints (e.g., must-run operational limits); but without explicit consideration of  
466 transmission grid operational costs.

467

468 The second process is the security constrained economic dispatch (SCED) solution of the units  
469 determined by the SCUC process. Here, the units are dispatched in a least-cost manner  
470 subject to various transmission operational constraints (e.g., line thermal limits, voltage support,  
471 etc.) and transmission reliability constraints (e.g., n- contingencies) to produce an overall least  
472 cost solution for regional load.

473

474 Data about the physical characteristics of generators, which are not related to costs and heat  
475 rates, will be reviewed and updated as needed by the members to provide company-specific  
476 values.

477

### 478 **3. Power System Model for the economic dispatch model**

479

480 The powerflow used in the 20-Year Assessment will be the latest MDWG model as approved by  
481 the TWG. Approved STEP projects as well as other special projects which are known by SPP  
482 staff (i.e. Entergy, AECI projects or those at other seams) will be added to the latest MDWG  
483 model as of the beginning of the study. This powerflow will be uploaded into the economic  
484 dispatch model.

485  
486 Dynamics models will be developed based on existing model sets and will incorporate additional  
487 generation and transmission projects added through the ITP process.

#### 488 **4. Resource Planning Data**

489  
490 The resource planning data will be vetted by stakeholders to ensure that the modeling of  
491 stakeholder's generation capacity is accurate. The stakeholders will have the opportunity to  
492 update their data to ensure an accurate model.

#### 493 **5. Constraint Selection**

494  
495 The current NERC Book of Flowgates will be used as an initial list of constraints. Throughout  
496 the analysis SPP will define additional constraints which will be vetted and approved by the  
497 TWG.

498  
499 Using a transmission analysis tool, SPP staff will identify additional constraints which should be  
500 monitored in the economic dispatch model. The nature of the economic study tools is such that  
501 the constraints are the only tool in the model which controls the flow on the transmission lines –  
502 without the constraints there is no adherence to the line or transformer limits, etc. This is an  
503 iterative process which will look for the next constraint. For the purposes of this analysis N-1  
504 and a few select PTDF interface constraints will be selected in order to control the flow in key  
505 transmission corridors. Not every flow will always be mitigated for every hour. Overloads can  
506 occur. The constraints are selected by performing an N-1 contingency analysis on all hours of  
507 the study year. All 300 kV and higher voltage facilities will be outaged; all 100 kV and higher  
508 voltage facilities in SPP will be monitored.

509  
510  
511

### 512 **E. Twenty-Year ITP Assessment Process**

513

#### 514 **1. Resource Planning**

515  
516 Language to be added by Black & Veatch.

#### 517 **2. Screening Analysis**

518  
519 SPP will start the screening analysis using prototypes which are developed based on previous  
520 EHV plans. These prototypes will be reviewed by stakeholders who have an opportunity to  
521 review the prototypes and offer feedback in their design. SPP will analyze a wide variety of  
522 possible transmission projects which have been identified by staff or suggested by stakeholders.  
523 The purpose of the screening analysis is to identify the grouping of projects which meet the  
524 goals of the future cost-effectively.

### 525 3. Security Constrained Unit Commitment and Economic Dispatch Analysis

526  
527 SPP staff will use a security constrained economic dispatch software for the economic and unit  
528 commitment analysis. The model will solve using nodal LMPs which will dispatch the  
529 generation economically based unit characteristics, load information, and transmission  
530 constraints.

### 531 4. Limited Reliability Assessment

532  
533 SPP staff will perform a limited reliability assessment to identify the impact the 20-Year  
534 transmission plans may have upon system reliability, in order to provide the most cost-effective,  
535 versatile backbone. The purpose of this assessment is to test the robustness of the  
536 transmission system and is not intended to be a test for NERC Reliability Standards  
537 requirements<sup>5</sup>.

538  
539 Due to the lack of an available year 20 powerflow model, a year 10 or year 11 powerflow model  
540 will be substituted as a proxy so that both voltage and thermal concerns can be evaluated. In  
541 order to be sure that the various futures and year 20 load levels are considered, analysis will  
542 also be performed on the year 20 cases.

543  
544 In order to assess reliability from multiple aspects, the limited reliability assessment will be  
545 divided into two portions. The first portion will be performed on the year 20 economic model,  
546 simulating the 20 year load levels and dispatch. The analysis will consist of a DC (thermal)  
547 contingency analysis, with and without the identified transmission plans, monitoring the 100 kV  
548 and above system while considering 300 kV and above contingencies.

549  
550 The second portion of the analysis will be performed on a year 10 or year 11 powerflow model,  
551 establishing a more thorough reliability evaluation of the 100 kV and above system. This  
552 analysis will consist of an AC (thermal and voltage) contingency analysis, with and without the  
553 identified transmission plans. SPP will monitor 100 kV and above facilities while considering  
554 100 kV and above contingencies. In this analysis mitigation plans will be developed for all  
555 violations. Additionally, a transfer capability (FCITC) will be performed on the year 10 or year 11  
556 powerflow model, with and without the identified transmission plans.

557  
558 A stability screening study will be performed to identify potential areas of instability. These  
559 results may influence the selection of projects for the ITP.<sup>6</sup>

560  
561 Those issues within SPP that are not addressed in this assessment will be passed to the 10-  
562 Year Assessment for further evaluation. Based on the results of these analyses, the EHV  
563 designs will be refined from a reliability perspective.

564

### 565 5. Solution Development

566  
567 During the process of the 20-Year Assessment, SPP staff will review issues that are identified  
568 during the various phases of the study. Those issues may include: thermal overloads, voltage  
569 violations, constraint congestion, LMP variation and trapped generation. Staff will present these  
570 issues to stakeholders and ask for feedback on EHV solutions to those issues. Those proposed

<sup>5</sup> Adherence to NERC Reliability Standards will continue to be checked through a separate NERC Reliability Compliance Assessment.

<sup>6</sup> For the 2010 ITP 20-Year Assessment, this analysis may not be performed.

**Comment [jbh1]:** From Doug K: In various places, "345kV+" shows up, sometimes without the notation EHV. Especially when just "345kV+" is noted, it is not clear as to whether the manual means "345kV and above", or if it means "above 345kV". It is further confused by SPP's use (in different documents) of EHV to mean it one way and in others the other way. And the power industry appears to use the EHV term for Above 345kV. I think in the manual here we mean to include 345kV. So I would recommend dropping the use of EHV and clearly stating what we mean in these places as ""345kV and above".

571 solutions will then be evaluated through a screening process to determine which solution sets  
 572 work best. The solution sets (or portfolios) that result from the screening process will be further  
 573 developed and refined through more detailed analysis which will include evaluation of benefit  
 574 metrics as described in Section III.G of this manual.

575  
 576  
 577 **F. Valuation**

578 The ESWG through its work with the Metrics Task Force (MTF) created the Metrics for 20-Year  
 580 ITP Document. The document includes a description on the metrics proposed to measure both  
 581 cost-effectiveness and robustness. The metric descriptions below have been taken from the  
 582 Metrics document which was approved by the ESWG and MOPC.

583 **1. Cost-Effective: Individual Futures**

584 I. Minimization of the total costs (transmission capacity, generation capacity and  
 585 APC) that meet the requirements of a specified future and;

- 586 ○ Includes emissions costs
- 587 ○ May include different fuel prices for different futures.
- 588 ○ Includes all the costs for EHV transmission
  - 589     ▪ The gathering systems would be developed during the ITP 10
  - 590         year plan (gathering systems have voltages less than 345kV).
- 591 ○ Includes an evaluation of whether or not a renewable energy standard or carbon  
 592 cap standard is met
  - 593     ▪ If not met, then add either transmission or generation capacity, whichever  
 594         is lower cost. For example:
    - 595         • For transmission capacity, increasing voltage
    - 596         • For generation capacity, increasing wind capacity
- 597 ○ Includes an evaluation of adjusted production costs for alternative  
 598 generation/transmission combinations that meet the future's target.
- 599 ○ Includes an evaluation on the cost of generation capacity depending on location  
 600 (i.e. high wind zones vs low wind zones).

601 II. Would include comparative costs from various sources

- 602 ○ Real losses of energy
- 603 ○ Reserve margins
- 604 ○ Do not include changes in exports or imports in specified futures,<sup>7</sup> i.e. fix the  
 605 import/export levels in the model to a historical level OR benchmark hurdle rates  
 606 to peg SPP imports/exports at a historical level<sup>8</sup>. The study report shall clearly  
 607 point out this limitation in assumption and describe how the results may be  
 608 affected by it, e.g., what if the wind development to the north of SPP is  
 609 considerably different (higher) than modeled, resulting in higher transfers through  
 610 north SPP.

<sup>7</sup> There is some value in the imports/exports. However, under SPC direction the impact of changes on the transmission system from imports/exports in the SPP region is being limited.

<sup>8</sup> SPP staff should provide an example of the two options.

- 612 III. Additional factors to consider in individual futures:
- 613     o There are attributes of the transmission plans that may be evaluated in addition
- 614     to lowest cost – to be provided later.
- 615     o Interconnection of new generation to target location (collection stations will be
- 616     addressed in the 10 year plan)
- 617         ▪ Some locations may be ideal for wind, gas, coal, nuclear, etc.
- 618     o Interconnect new generation (GI process facilitation)
- 619         ▪ The EHV will target locations based on GI clusters and load which would
- 620         add additional value.
- 621         ▪ Targeting location of EHV based on access for desirable application
- 622         ▪ Alternative View - Might fall into the “collector system” context which
- 623         would be evaluated more in the 10 year ITP when looking at lower
- 624         voltage, therefore it should be a 10 year ITP metric.

Comment [jbh2]: Rework into paragraph form

627 **2. Flexibility: Meeting Multiple Futures**

628 I. Multiple Futures

- 629 • Projects that show up multiple times as cost effective for each future make for cost
- 630 effective planning.
- 631     o Interconnections at target locations which show up in multiple futures will have
- 632     greater weight.
- 633 • There is a weighting aspect that needs to be developed for ESWG and SPC
- 634 consideration. This may include identifying different plans per future. The futures will be
- 635 weighted by stakeholder determination.
- 636 • Cost effective solutions for individual futures may need to be modified in order to find a
- 637 cost effective solution for multiple futures
- 638 • Additional factors to consider in multiple futures
- 639     o Improved interconnection of new generation
- 640     o Dispersion vs concentration of generation resources and the cost impact under
- 641     different futures (i.e. wind)
- 642     o Alignment of projects with plans external to the SPP region in accordance with
- 643     FERC Order 890

644 II. Approach 1: Scenario Analysis

- 645 • Requires assignment of weights to various futures as noted above
- 646 • Requires running all futures against various transmission/generation plans
- 647     o The transmission plans being evaluated for multiple futures will meet the
- 648     requirements of each of the futures;
- 649     Or
- 650     o If not, must include an estimated cost for not meeting those requirements.
- 651     o These estimated costs must be documented along with rationale for subsequent
- 652     changes.
- 653 • Evaluates various transmission plans in terms of the transmission plan that has the
- 654 highest weighting for the lowest costs.

656 III. Approach 2: Contingency Analysis

- 657 • **This is not an N-1 AC analysis. This is an adaptive process to calculate a value of**
- 658 **the ITP in financial terms.**

- 659 • Overall plan is based on the future having the highest weight; i.e., the agreed upon  
660 **expected** future.
- 661 ○ Requires a determination of which upgrades are built first (before the  
662 uncertainties are resolved); i.e., would include portions of the transmission  
663 system that are required for multiple futures
- 664 ○ Requires a process by which designs can be changed in the event that the  
665 **expected** future does not come to fruition – contingency plans to go with the plan  
666 designed to meet the expected future.
- 667 • Can include the use of weights in the evaluation of having to change the plan when  
668 futures that are not expected occur.
- 669 ○ Can evaluate transition costs in terms of a comparison to the costs incurred had  
670 the system been built to meet the alternative future.
- 671 ○ Various alternatives can be evaluated using this same measure and compared  
672 on an expected value basis; i.e.,  
673 **(Wgt\*Cost of plan) +  $\sum_j$ (Wgts\*Transition costs of alternative futures);**  
674

675 **3. Robustness Metrics (will be updated as ESWG reviews the CRA results)**

- 676 I. Captures added value not previously quantified/qualified in SPP’s traditional  
677 planning methods.
- 678 a) Improvements in reliability (value of improving the ability to keep the lights on)
- 679 ○ Value of delaying or advancing previously approved reliability projects
- 680 ○ Other values such as a backstop to a catastrophic event.
- 681 ○ Value of improved available transfer capability
- 682 b) Provides additional information to be considered in the siting of new generation  
683 capacity
- 684 ○ Locating transmission in proximity to:
- 685 ■ Better wind locations
- 686 ■ Concentration of natural gas lines
- 687 ■ Water availability
- 688 ■ Rail access
- 689 ■ Lignite or coal resources
- 690 ■ Solar sites
- 691 ■ Highways
- 692 ■ Load centers, substations sites
- 693 ■ Environmentally sensitive areas
- 694 ■ Existing corridors
- 695 c) Losses not captured by APC such as generation losses due to curtailment.
- 696 ○ The value of an increase or decrease in transmission line losses are captured  
697 in APC.
- 698 ○ The amount of additional or reduced energy due to a change in losses will be  
699 reported separately from amount embedded in the APC.
- 700 d) Increased effective capacity factors
- 701 ○ Capacity factor improvement of resources between the base and change  
702 cases, the capacity factor may change due to a reduction in congestion.
- 703 ○ Measures the benefit of adding transmission to reduce congestion on  
704 curtailed resources.
- 705 e) Ability to reduce cost of capacity held in reserve for regulation<sup>9</sup>

<sup>9</sup> Currently unable to define.

- 706 ○ The nodal security constrained economic dispatch software may not be the
- 707 correct tool for this metric.
- 708 ○ Will focus more on hourly or five minute support and not planning or
- 709 operating reserves. More focus placed on spinning reserve and ACE.
- 710 f) Positive impact on capacity losses
- 711 ○ Reduced capacity that can be reflected in reduced losses and the possible
- 712 reduction in capacity margins.
- 713 ○ This metric will be used to capture a value for the capacity which may no
- 714 longer be required due to a reduction in losses and capacity margin.
- 715
  
- 716 II. Levelization of LMPs
- 717 • This could be indicative of the value of transmission in providing access to economical
- 718 sources of generation measured by the standard deviation in LMP price across the SPP
- 719 footprint.
- 720 • Formula could be based on what the SPP Markets group uses in the Monthly State of
- 721 the Market Report
  
- 722 III. Improved access to economical resources participating in SPP Markets
- 723 • Qualitative and quantitative based on quantitative metrics such as APC, volatility,
- 724 increased sales, etc.
- 725 • Assesses the value of the, now 187 and possibly more, commercial paths where
- 726 capacity increases and the average rate of the increase with additional transmission.
- 727 • Can be measured retroactively by calculating the number of new participants in the
- 728 Market by Market Monitoring efforts.
  
- 729 IV. Change in operating reserves
- 730 • Calculation of reserves before and after transmission projects (MW x \$/MW
- 731 implementation cost)
- 732 • Loss of Load Probability (LLP) studies will show the reduced requirements.
- 733 • Use Gas CT as base construction
- 734 • Evaluation of the regulation and following reserves needed for wind resources
- 735 • Reduction in need for reserve zones
  
- 736 V. TLR Reduction – Enabling Market Solutions
- 737 • This should be a subset analysis that would not be a full 8760 hr analysis. This analysis
- 738 could be limited to a subset of days or hours.
- 739 • Capture the value of fewer transmission loading reliefs during specific durations of the
- 740 year.
- 741 • The valuation will be based on a review of historical and projected data.
  
- 742 VI. Limited export/import improvements
- 743 • Will capture the effects on both the generation and the load.
- 744 • Need to consider the requirements under FERC Order 890 but not specifically use the
- 745 import/exports capabilities for valuing the transmission projects in the ITP. Multi-region
- 746 studies should capture the issues related to what is needed for import/export capability
- 747 under Order 890. Surplus wind exports would be handled under multi-regional studies.

- 748 VII. Improved economic market dynamics not measured in the security constrained  
749 economic dispatch model.
- 750 • Can be used to look at constrained areas
  - 751     o Does an increase in robustness eliminate, to a degree, the need for Narrowly  
752         Constrained Areas as defined by MISO?
  - 753 • This metric will be used to capture the value of eliminating load or congestion pockets  
754     due to the reduction of redispatch.
  - 755
- 756 VIII. Improved economic market dynamics measured in the nodal security constrained  
757 economic dispatch model
- 758 • Value added by the change in average marginal cost. Determine if the cost of the next  
759     marginal MW increased or decreased due to the addition of the transmission project.
  - 760 • Marginal cost is defined as the cost of the marginal unit
  - 761 • Has the cost of the next marginal MW increased or decreased by adding the additional  
762     transmission project?
  - 763 • Averaged over either an on or off peak period or a full 8760 analysis as determined by  
764     SPP staff
- 765 IX. Reduction in market price volatility
- 766 • This relates to volatility over time and not geographic volatility
  - 767 • Hedging tools will be reduced in value with less price
  - 768 • Without stochastic analysis this metric is difficult to capture.
  - 769 • The stochastic analysis would require a significant amount of computer time.
- 770 X. Reduction of emission rates and values
- 771 • CO<sub>2</sub>, NO<sub>x</sub>, SO<sub>2</sub>, values will be input into the model, thereby capturing the impact to the  
772     dispatch and the APC.
  - 773 • Currently the application for mercury is not well defined; however the units of mercury  
774     emissions will be captured. Reducing pounds/tons of mercury has different values to  
775     different market participants.
- 776 XI. Transmission corridor utilization
- 777 • How to efficiently utilize the ROW
  - 778 • Must also consider the environmental impacts of the transmission.
- 779 XII. Ability to reduce cycling of base load units
- 780 • Excessive cycling increases maintenance costs of units requiring capital investment.
  - 781 • New transmission that would impact this cycling would provide a value to the generation.
  - 782 • Cycling is defined as a unit ramping up and down within its minimum and maximum.
  - 783 • The number of cycles is determined by counting the number of times a unit's output  
784     crosses the average operating level.
  - 785 • The BA or TO will determine what is considered "normal" and "excess" cycling.
  - 786 • This metric will apply to coal and nuclear plants which are 350MW and larger.
- 787 XIII. Generation Resource Diversity
- 788 • Fuel diversity adds fuel adjustment rate stability.

- 789 XIV. Ability to serve unexpected new load  
790     • Results could be captured when you have unexpected extreme load growth.  
791     • Transfer X% of additional energy to a load pocket with low impact on LMPs.  
792     • Test the robustness by shifting load from one major load center to another.
- 793 XV. Part of Overall EHV Overlay Plan  
794     • There is some value if the interim projects solve an immediate problem and can be  
795     incorporated into the long term comprehensive EHV Plan.  
796  
797

798 **G. Deliverable**  
799

800 **1. Finalize Solution**

801  
802 Prior to developing the final set of projects, SPP staff expects to have a transmission plan  
803 developed for each future. Those multiple plans will be analyzed to determine which projects or  
804 combination of projects would be beneficial in all futures. The results of this analysis will be a  
805 single transmission plan (composed of multiple 345 kV+ projects) that is robust, being adaptable  
806 for all of the futures considered, and adding greater incremental value than incremental cost.  
807

808 **2. Report**

809 The deliverable for the 20-Year analysis will be a single transmission including staging and  
810 timing considerations to convey the appropriate order of implementation. The results of the  
811 analysis will be included in the 20-Year ITP Report.  
812  
813

814 **IV. Ten-Year Integrated Transmission Planning**

815 The process for the 10-Year Assessment has not yet been developed. Once the process  
816 development has been completed this section of the manual will be updated to include that  
817 process.

912

913 **V. Near-Term Integrated Transmission Planning**

914 The third phase of the ITP process is the annual Near-Term Assessment, which will be  
915 performed annually on a rolling window to be defined in the ITP study scope document. This  
916 assessment will analyze the Transmission System for solutions according to NERC Reliability  
917 Standards while incorporating individual Transmission Owner planning requirements. The  
918 assumptions for this assessment will be narrowed further than those for the 20-Year and 10-  
919 Year Assessments. This narrower focus is intended to ensure continuous adherence to NERC  
920 Reliability Standards while allowing the ITP process as a whole to focus on the creation of a  
921 Transmission System that meets the ITP planning principles.

922  
923

924 **A. Purpose**

925

926 The ITP Near-Term Assessment determines the SPP upgrades required to meet reliability in the  
927 near-term, including those upgrades recommended to the SPP BOD to receive an NTC.

928

929 **B. 20-Year and 10-Year ITP Interaction**

930

931 The ITP 20-Year and 10-Year plans will be incorporated into the Near-Term Assessment  
932 annually. The plans will serve as part of a pool of solutions from which the Near-Term plans are  
933 developed to determine the best regional solution for the SPP footprint. There will also be  
934 interaction of the plans based on issued ATPs and NTCs.

935

936

937 **C. Data Requirements**

938

939

940 ~~Per SPP Criteria 3.5, when an entity is in the conceptual planning stages of new facilities that~~  
941 ~~impact the interconnected operation of the Transmission System, it shall contact the~~  
942 ~~Transmission Provider so that the optimal integration of any new facilities and potentially~~  
943 ~~benefiting parties can be identified.~~

944

945 In preparation for the annual update of transmission planning models for each annual planning  
946 cycle, SPP Members, Transmission Customers and other stakeholders must provide to the  
947 Transmission Provider the data specified in Section VII of Attachment O of the OATT.

948

949 During the course of the annual planning cycle, if material changes to the data occur, the data  
950 owners must provide timely written notice to the Transmission Provider.

951

952 Instructions to access modeling information are posted on the SPP website.<sup>10</sup>

953

Deleted: Any entity that is subject to the NERC Reliability Standards is required to provide data to the Transmission Provider in accordance the NERC Reliability Standards for Modeling, Data and Analysis (the "NERC MOD Standards"). ¶

<sup>10</sup> <http://www.spp.org/section.asp?pageID=108>

960 **1. Confidentiality of Data**

961  
 962 In addition to the treatment with respect to reporting requirements in Section 2.6, in all other  
 963 activities SPP Staff will take all reasonable efforts to preserve the confidentiality of information in  
 964 accordance with the provisions of the SPP Tariff (i.e., Sections 17.2(iv) and 18.2(vii);  
 965 Attachment V (Section 13.1 and Article 22 of Appendix 6); Exhibit 1 (Section 2.3);  
 966 Attachment AJ (Section 8); and Attachment C-One (Clause 7)).

967  
 968  
 969  
 970 **D. Assumptions**

971  
 972 The Near-Term Assessment will be performed on an annual basis. The study will be performed  
 973 on a shorter planning horizon than the 10-Year assessment and will focus on the reliability of  
 974 the system. The Near-Term Assessment will take the following into account:

- 975
- 976 • NERC Reliability Standards;
- 977 • SPP Criteria;
- 978 • Transmission Owner-specific planning criteria as set forth in Section II of Attachment O;
- 979 • Previously identified and approved transmission projects;
- 980 • Zonal Reliability Upgrades developed by Transmission Owners, including those that
- 981 have their own FERC approved local planning process, to meet local area reliability
- 982 criteria;
- 983 • Long-term firm Transmission Service;
- 984     o Accommodate and reflect the specific long-term firm transmission service requests
- 985     of the Transmission Customers and specific interconnections of Generation
- 986     Interconnection Customers no later than when the relevant Service Agreements
- 987     and interconnection agreements are accepted by the Commission.
- 988 • Load forecasts, including the impact on load of existing and planned demand
- 989     management programs, exclusive of demand response resources;
- 990     management programs, exclusive of demand response resources;
- 991 • Capacity forecasts, including generation additions and retirements;
- 992 • Existing and planned demand response resources; and
- 993 • In developing the long term capacity forecasts, the studies will reflect generation and
- 994     demand response resources capable of providing any of the functions assessed in the
- 995     SPP planning process, and can be relied upon on a long-term basis. Such demand
- 996     response resources shall be permitted to participate in the planning process on a
- 997     comparable basis to the service provided by comparable generation resources where
- 998     appropriate.
- 999

1000 TWG has oversight of the Near-Term Assessment.

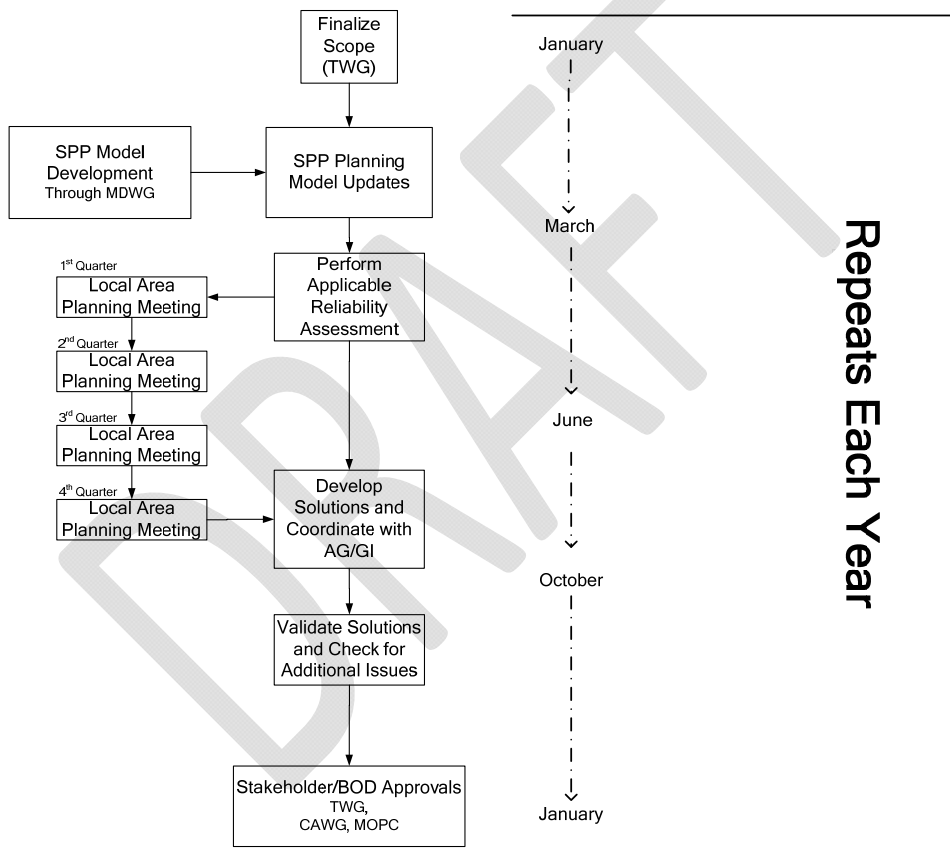

1001  
 1002 **1. MDWG Modeling**

1003  
 1004 Staff will use the SPP Model Development Working Group (MDWG) models as a starting point  
 1005 for the ITP Near-Term analysis. The MDWG creates new steady-state and dynamic models  
 1006 annually and updates these models throughout the year.

1010 **E. Near-Term ITP Process**

1011  
 1012 Planning within SPP is a collaborative process with Transmission Owners, users, and other  
 1013 stakeholders. This Near-Term Assessment process requires that Transmission Owners  
 1014 continue to develop expansion plans to meet the needs of their systems. At the same time, SPP  
 1015 assesses its system for the ability to meet applicable reliability standards and address  
 1016 stakeholder concerns, including those of regulators.

1017  
 1018 The 12-month Near-Term planning process focuses on the system’s reliability needs and the  
 1019 commercial and market needs for all the stakeholders in the SPP footprint. This process was  
 1020 developed by SPP staff in conjunction with the TWG. The process is shown in the figure below.  
 1021

1022  
 1023  
 1024 Details regarding key assumptions, models, project data, specific tasks, outstanding issues,  
 1025 progress reports, maps, and study results are available on the SPP web site.

1072

1073

The steady-state model building begins in January and starts with the SPP MDWG spring case topology of that same year of the study. Transmission owners and balancing authorities provide generation dispatch and load information for the years to be studied.

Transmission owners enter network changes into MOD at which time the type and status of the network upgrades is identified. The type and status of MOD projects identify into which SPP model set the network change will be entered. Appendix A of this manual provides the listing of the description of the types and statuses.

Included in the Near-Term Assessment models (i.e. ITP Reliability models) are all topology changes that have a NTC from SPP except projects that have been requested to be removed from the base ITP reliability models. These exceptions must go through a stakeholder review process as described below:

- 1) Stakeholder requests NTC project be removed from the base ITP reliability model along with the reason why they would like the project excluded and re-evaluated in the ITP Near Term.
- 2) If SPP Tariff Study Group identifies any Transmission Service that may be dependent upon the project, SPP Planning Group would identify any concerns in connection with removing the project from the base model and re-evaluating the need
- 3) The list of NTC projects to be re-evaluated is given to stakeholders for a 15 day review and comment window.

Generation interconnection facilities are included in the ITP reliability models if they have an executed Interconnection Agreement (IA) and not on suspension. Generation capacity does not get included in the assessment until there is an executed transmission service agreement.

Confirmed Long Term Firm transmission service is included in the ITP reliability models. In addition to Confirmed Firm service mentioned above, the following will also be included: 1) transactions to make generation and load match. ; 2) proposed generation stations and associated service from new generation that has a high probability of going into service; i.e. If a planned generating resource does not have a TSR filed service agreement but does have both a high probability of going into service and a high probability of obtaining an executed transmission service agreement, that new generator's service can be included in the SPP regional reliability planning models if it meets all of the following requirements:

- o A formal request has been sent to SPP requesting the generation capacity be included into the ITP;
- o The generating resource has a FERC-filed IA not on suspension or FERC-filed interim IA;
- o The generating resource has acquired the funding for major equipment;
- o The generating resource has entered the Aggregate Study or equivalent; Transmission Owner transmission service study publicly posted on OASIS and has a completed facility study that is waiting for final results without unmitigated third party impacts<sup>11</sup>;

<sup>11</sup> Eliminates generators that may drop out as a result of changes in study results

- 1074 ○ The generating resource has acquired air and environmental permits where
- 1075 applicable;
- 1076 ○ The generating resource has started construction with major equipment
- 1077 procurement contracts awarded; and
- 1078 ○ The generating resource's unit(s) must be dispatchable and committable.
- 1079 ○ If a generating resource does not meet all the above requirements, a formal
- 1080 request for generation capacity to be included in the ITP Near-Term can be made
- 1081 to TWG on a case by case basis.

1082  
 1083 In later years of the Near-Term Assessment analysis when there is a shortfall between  
 1084 interchange, generation, and load, the following process will be used to address generation  
 1085 deficiencies<sup>12</sup>.

- 1086
- 1087 1) Exhaust the dispatchable generation of the network customer,
- 1088 2) Exhaust the Independent Power Producers (IPP) dispatchable generation in the same
- 1089 model area,
- 1090 3) Dispatch the remaining unused, dispatchable generation on a pro rata basis within SPP
- 1091 footprint.

1092  
 1093 SPP uses scenarios to evaluate reliability. The number of scenarios is determined each year  
 1094 and approved by the TWG.

1095  
 1096 Below is a flow chart of the SPP planning modeling process.

# SPP Planning Modeling Process

August 2010

## 2. Inter-Regional Coordination

SPP is responsible for coordinating transmission planning with each neighboring interconnected system. SPP will coordinate any activities and studies based on the agreements listed in Addendum 1 to Attachment O of the OATT. As part of the inter-regional coordination process, SPP will share system plans with neighboring entities and identify system enhancements on the seams.

## 3. Transmission Operating Guides

SPP uses Transmission Operating Guides in its Near-Term Assessment analysis. Appendix B of this manual contains the SPP procedure to address use of operating guides in planning studies.

## 4. Assessment Methodology

Each year the assessment's scope is developed and approved by the TWG. The scope will contain following:

- The years and seasons to be modeled
- Treatment of upgrades in the models
- Scenario cases to be evaluated
- Description of the contingency analysis and monitored facilities
- Any new special conditions that are modeled or evaluated for the study
- Stability analysis may be performed using 5-6 year models<sup>13</sup>

## 5. Solution Development

After SPP performs the reliability assessment identifying the bulk power problems, SPP will present and solicit Transmission Owners and stakeholders for transmission solutions to those reliability problems. SPP solicits stakeholders in several forums including the planning summits and working group meetings. After receiving feedback from stakeholders, SPP will take current Aggregate Studies and Generation Interconnection studies into consideration to develop and validate the best regional solution for problems. Then SPP shares the proposed solutions with the members and stakeholders at various stakeholder meetings asking for additional feedback on the solutions. This process repeats for several iterations as staff refines the solutions in a set timeline.

Throughout the process, alternative solutions are proposed by stakeholders. SPP analyzes those alternatives in accordance with Section III.8 of Attachment O of the OATT.

## F. Deliverable

The deliverable for the Near-Term Assessment will be a list of 69 kV+ projects that would maintain the reliability of the SPP Region in the near term horizon.

In developing the annual STEP report, staff will include a section about the annual Near-Term Assessment. This section will summarize the regional, sub-regional and local transmission needs of the SPP Region in the near term horizon which is assessed to meet SPP's reliability needs. The Near-Term Assessment results will also contain a list of at least the following upgrades:

---

<sup>13</sup> This stability analysis will be performed once per ITP cycle (i.e. every three years).

- o Regional upgrades required to maintain reliability in accordance with the NERC Reliability Standards and SPP Criteria in the near term horizon;
- o Zonal upgrades required to maintain reliability in accordance with more stringent individual Transmission Owner planning criteria in the near term horizon; and
- o Inter-regional upgrades developed with neighboring Transmission Providers to meet inter-regional needs, including results from the coordinated system plans, in the near term horizon.

**1. Finalize Solution**

Throughout the Near-Term Assessment process, SPP shares, discusses, and refines proposed solutions with stakeholders. The solutions are finalized in the annual STEP report.

**VI. Issuance of NTCs and ATPs**

Once the ITP is reviewed by the MOPC and approved by the BOD, staff will issue NTC letters for approved projects in the 20-Year, 10-Year, and Near-Term Assessments which are within the financial window as approved by the BOD. The NTC is sent to the incumbent Transmission Owner(s) for the project. All other projects approved by the BOD in the ITP will receive an Authorization to Plan (ATP). All of the projects for which an ATP is issued will be posted on the SPP website. ATPS will be included in all future Aggregate Study and Generation Interconnection study models.

**VII. Reporting Requirements**

Staff will inform the appropriate working groups throughout the year of the progress of the ITP assessments. SPP will also report on these assessments in its annual STEP report which will include a list of projects from those assessments. The STEP report will be presented to the BOD for approval.

**A. Stakeholder Review Process**

To show transparency in its planning processes, SPP holds planning summits that allow stakeholders opportunity to engage in, develop, and review SPP’s on-going planning assessments and their results. SPP also has working groups meetings as another forum for stakeholders to become involved in SPP planning studies.

## Appendix B

### SPP Transmission Operating Guides Review Procedure

This procedure documents the process of how a Transmission Operating Guide (TOG) shall be included in the ITP and SPP Aggregate Transmission Service Studies (ATSS). In most cases TOGs are not intended to indefinitely defer needed Transmission System upgrades. Effective TOGs shall be utilized in all transmission tariff service functions and OATT planning processes.

For a TOG to be considered for use in the ITP and ATSS as a possible mitigation plan, it shall be on file with SPP. An effective TOG must state the system conditions under which the TOG is to be used and describe, in detail, the action the operators will take. The TOG must be signed by someone in charge of operations from the Transmission Owner or transmission operator submitting the TOG.

An effective TOG shall continue to be used in evaluation of the ITP and ATSS unless the facility-owning Transmission Owner or transmission operator withdraws the TOG. In cases where the TOG is withdrawn before the TOG becomes ineffective, any Transmission System Upgrades lie with the Transmission Owner.

A new TOG provided as interim mitigation for an SPP-required project shall automatically be withdrawn when the project is completed.

A TOG is considered an effective solution for facilities that are not listed in the TOG if, in the act of implementing the TOG for the elements listed, other overloads or voltage violations are corrected.

Service Upgrades associated with new Transmission Service Requests or Designated Resources that cause a TOG to be ineffective will be classified as Base Plan Upgrades in accordance with Attachment J.

Transmission System upgrades that become necessary because a TOG has been identified to be ineffective in order to maintain the reliability of the Transmission System shall be categorized as Reliability Upgrades, utilizing the procedures of Attachment O of the OATT.

The upgrade(s) proposed to address an ineffective TOG may work towards either eliminating the TOG or the ineffectiveness of the TOG.

### Effective TOGs

1. A TOG addressing Transmission System loading must include a short-term emergency rating which allows sufficient time to implement the TOG.
2. A TOG requiring generation redispatch must indicate if generator location is critical and, if so, must state in detail which units or plants will be re-dispatched. Absence of such specificity means location is not critical and generators may be selected from the fleet the entity has authority to run. The ramp rate of the generation must be capable of relieving the overload or voltage issue within the time allowed as specified in the TOG.
3. A TOG must not cause a violation elsewhere on the Transmission System.
4. A TOG addressing a voltage violation must provide for restoring minimum acceptable voltage conditions within a time frame so as not to cause permanent equipment damage.

A TOG shall identify the means by which system control is implemented. That is, if supervisory control is utilized it must so state.

DRAFT

Exhaust the customer's dispatchable designated network resources until the network resources are sufficient to meet network load.

Dispatch generation by using dispatch orders provided by the transmission planning personnel of the SPP Transmission Owners and by representatives of the transmission service customers.

Add generation from behind the meter generating units. This generation consists of dispatchable behind the meter generation that may not already included in the SPP MDWG models.

If the customer's dispatchable designated load cannot be served after Step One, then exhaust the customer's other dispatchable, operational generation that is not designated.

Dispatch generation by using dispatch orders provided by the transmission planning personnel of the SPP Transmission Owners and by representatives of the transmission service customers.

Add generation from behind the meter generating units. This generation consists of behind the meter generation that may not already included in the SPP MDWG models.

If the customer's designated load cannot be served after Step One and Step Two, exhaust the Host Transmission Owner's existing dispatchable generation.

Dispatch generation by using dispatch orders provided by the transmission planning personnel of the SPP Transmission Owners and by representatives of the transmission service customers.

If the customer's network load cannot be served after the above steps, exhaust Independent Power Producer's ("IPP") existing dispatchable generation in the Host Transmission Owner's modeling area.

Exhaust IPP generation on a pro rata, as available basis accounting for firm transmission commitments. In other words, Use power from each IPP to meet the customer's designated load. The amount of power from each IPP will be determined using the total amounts available based on the IPP's historical generating levels minus the amount of power to model existing transmission service from the IPP.

Finally, if a customer's network load cannot be served after applying the above steps, exhaust existing primary modeling area dispatchable generation with includes IPP's existing generation and existing primary modeling area generation.

Similar to Step Four, exhaust this generation on a pro rata, as available basis for firm transmission commitments. The amount of power from each IPP and from each primary modeling area generation will be determined using the total amounts available based on the maximum generating levels minus the amount of power to model existing transmission service from the IPP and primary modeling
